

AVTools System Designer v2.2.2 Release Notes

Release date: May 2026 **Revit compatibility:** 2025, 2026 **Editions:** Standard, Pro

Summary

v2.2.2 is a **trust release**. The MSI installer and every internal DLL shipped in this build are now digitally signed by **J. Stevens BIM Acoustics LLC** using **Microsoft Azure Trusted Signing** (the service formerly known as Azure Artifact Signing / Azure Code Signing).

There are **no functional changes** in this release. The product behaves identically to v2.2.1. The entire change set is in how the bits arrive on a customer's machine — Windows can now cryptographically verify that the build came from J. Stevens BIM Acoustics LLC and hasn't been tampered with in transit.

What's new

First fully signed release

This is the first AVTools System Designer release where both the installer and every internal DLL carry an authentic, Microsoft-anchored digital signature.

To verify on any machine where v2.2.2 is installed:

1. **Right-click the MSI** (or any of the installed DLLs under `C:\Program Files\BIM Acoustics\AVTools System Designer\`) 2. **Properties** → **Digital Signatures** tab 3. The signer reads as **J. Stevens BIM Acoustics LLC**, with a Microsoft-anchored certificate chain back to a trusted root

The UAC prompt that appears during install now shows **Verified publisher: J. Stevens BIM Acoustics LLC** instead of the previous *Unknown Publisher* warning — the single most important credibility signal for enterprise customers evaluating whether to install AVTools on a Revit workstation.

Functional changes

None. All features, behavior, calculations, parameter writes, schedule outputs, Lucius integration, license enforcement, and EULA acceptance scaffolding are byte-for-byte equivalent to v2.2.1. Project state files, license activations, per-room configuration, EULA acceptance records, and rack/loudspeaker filter selections from v2.2.1 carry forward unchanged.

Known limitation

Windows SmartScreen may still warn on first download

For a period after this release, the SmartScreen reputation engine may continue to display its "Windows protected your PC" warning when the v2.2.2 MSI is downloaded fresh by customers who have never installed AVTools before.

This is **normal** for newly signed publishers. Microsoft removed the long-standing "instant trust" for EV (Extended Validation) code signing certificates in 2024 — every publisher, regardless of certificate class, now has to build SmartScreen reputation organically through download volume and clean execution history. The Trusted Signing certificate AVTools now uses is functionally equivalent to an EV cert in every way that matters for installer trust, but it does not bypass SmartScreen reputation.

The warning dissipates as the signed build accumulates download history. In practice, the worst-case window is a few weeks; for active publishers the reputation builds within days.

If a customer encounters the SmartScreen warning, they can click **More info** → **Run anyway** to proceed. The signed publisher string they see in the warning dialog is still authoritative — *Verified publisher: J. Stevens BIM Acoustics LLC* on every line.

Upgrading

v2.2.2 supersedes v2.2.1 via the same MSI Upgrade Code. Existing v2.2.1 installations will be uninstalled and replaced in place when v2.2.2 is run — no manual cleanup, no separate uninstall step.

Project state, license activation, per-user EULA acceptance records, and per-user rack/loudspeaker filter selections all carry forward unchanged across the upgrade. The first launch on each Windows user account after the upgrade does *not* re-prompt for EULA acceptance, since the EULA version itself has not changed (still v1.0).

For support

If a customer reports any signature-related issue (unexpected publisher name, broken certificate chain, SignTool verification failure, etc.) after installing v2.2.2:

1. Confirm the file is the v2.2.2 MSI and not a v2.2.1 leftover
2. Have them run `signtool verify /pa /v "C:\path\to\AVTools-System-Designer-2.2.2.msi"` from an elevated command prompt — the output should show **Signing Certificate Chain** ending at a Microsoft Trusted Signing root
3. Email **support@bimacoustics.net** with the full signtool output attached
