

AVTools System Designer v2.2.1 — Release Notes

Release date: May 2026 **Revit compatibility:** 2025, 2026 **Editions:** Standard, Pro

What's new

In-app End User License Agreement at first launch

The first time you open System Designer (and once again whenever the agreement text is materially updated), a modal dialog now presents the full AVTools End User License Agreement. Scroll through, tick the "I have read, understood, and accept the terms" checkbox, and click **I Accept and Continue** to proceed into the shell. The acceptance is recorded per Windows user at

`%APPDATA%\BimAcoustics\license-acceptance.json` with the EULA version, UTC timestamp, your username, and machine name — a verifiable record of click-wrap consent.

The dialog is decoupled from the installer, so the same EULA enforcement applies whether you installed via the website MSI, sideloaded the DLLs, or — in the future — receive the build through the Autodesk App Store.

Per-family loudspeaker filter dialog

When you click Scan Loudspeakers on the Configuration tab, AVTools now opens a tick-box dialog of every family that survived the classifier, alongside its instance count, category, and an example room. Families carrying JSBA or AVIXA loudspeaker parameters are auto-ticked and labelled **Stamped**; the rest you accept or reject by checkbox. The dialog uses the same pattern as the Rack Family Selection dialog from v2.2 — same Shift+click range select, same Space-to-toggle, same "Only New" and "Only Stamped" bulk actions.

The choice is persisted so the dropdown stays curated across reboots. Reviewing the list is the easy fix when generic Revit families like wayfinder displays or microphones keep slipping into your speaker dropdown.

User-level state for rack and loudspeaker filter choices

Family selections from both the rack filter and the new loudspeaker filter now live at **user scope** rather than project scope. The new `%APPDATA%\BimAcoustics\UserState.json` file captures which families you've classified as racks and which as loudspeakers, and that decision carries forward to every project you open on your machine. Open a new project and the curated lists are already there. Existing per-project lists from v2.2 are merged into the user-state automatically on first launch.

Filter dialog z-order and multi-select hardening

Both the rack and loudspeaker filter dialogs now stay reliably in front of the AVTools shell window when they appear during the initial scan (previously could land behind the dockable pane on some Revit configurations). Shift-click for range selection, Space to toggle Include for all selected rows, and ticking any one checkbox in a multi-row selection now propagates the choice to the rest of the selection.

Cloud-delivered Lucius knowledge base

Lucius's underlying knowledge — feature documentation, AV design guidance, response framing rules — is now delivered from the cloud rather than embedded in the add-in DLL. Updates to Lucius's understanding of AVTools, audio design best practices, and recent product changes now reach every active user the moment they're published, without an installer rebuild. The local fallback content shipped with this build still serves as an emergency offline reference if the cloud service is briefly unavailable.

A side effect: per-request payload to the Lucius gateway dropped from ~120 KB to ~6 KB. Anthropic prompt caching on the gateway side absorbs the large pack content once per conversation, so Lucius response latency is unchanged or slightly improved.

Ribbon icon and label refresh

The System Designer ribbon button has a redrawn icon (pendant loudspeaker with three sound waves), properly rendered at 16- and 32-pixel sizes instead of being downsampled from a high-resolution source. The button label is now **System Designer** (was "AV Design"), better aligned with the official product name, and the hover tooltip describes the full feature scope rather than just the linked-model ceiling placement edge case.

Bug fixes

- **Place Rack ID Tags now spans every level.** A face-hosted-rack defect could collapse all rack tags onto the active view's floor plan instead of distributing them across the levels where racks actually sit. Level resolution now uses the rack's physical Z position to find the floor it's mounted on. The result dialog also gains a per-view breakdown so you can confirm at a glance that tags landed on every level plan.
- **Installer ships all required DLLs.** Earlier v2.2 builds were missing `JSBA.AVTools.RevitCore.dll` and `JSBA.ArrayBridge.dll` from the install set, which surfaced as `FileNotFoundException` when scanning Rooms or Loudspeakers on a clean install. Both DLLs are now properly registered with the installer and copied to the install folder.
- **Filter dialog usability fixes.** Z-order, multi-select, and checkbox propagation issues reported by users in the v2.2 timeframe are addressed across both the rack and loudspeaker filter dialogs.

Upgrade notes

- The v2.2.1 installer upgrades cleanly over any v2.x version — the previous build is uninstalled and replaced automatically. Project state, license activation, and per-room configuration are preserved.
 - The first launch on each Windows user account will show the EULA acceptance dialog once. Existing users who installed v2.2 are not exempt — the agreement is a new requirement of this build.
 - `%APPDATA%\BimAcoustics\UserState.json` is created on first launch and seeded with any rack-family selections found in the per-project state from v2.2 projects you open. No manual migration step required.
 - No project state schema change. State JSON files from v2.0 / v2.1 / v2.2 are read without modification.
 - Bundled JSBA family files (Circuit ID tags, Rack ID tag, Coordination markers, Records) are refreshed on first launch as in prior versions.
-

Known caveats

- The MSI is not yet code-signed. Microsoft Trusted Signing certificate enrollment is in progress; until completion (estimated mid-June 2026), Windows UAC will display "Unknown Publisher" during install. The SHA256 hash of the MSI is published on the download page for integrity verification.
 - The EULA text shipped in this build is a working version pending final legal review. The substance of the agreement will not change before final review; specific language may be tightened or clarified in v2.2.2.
